# Estimating the Max Capacity in Work Zone Area 

Elham Sharifi

## 1. Introduction

There are different definitions of capacity at a work zone area. For example "Hourly traffic volume under congested traffic conditions" or "Hourly traffic volume converted from the maximum-recorded five minute flow rate" or "Flow rate at which traffic behavior quickly changes from uncongested conditions to queued conditions" or "Flow just before a sharp speed drop".

Our objective in this project is Estimating max capacity in work zone area and we have two capacity definition, "Max throughput" and "Flow rate at which traffic behavior quickly changes from uncongested conditions to queued conditions. (Traffic volume immediately before queue begins)".

## 2. Survey Data Analysis

A Survey has been done in September 2007 in 6 days at work zone locations. They used 4 camcorders to videotape the traffic volumes. I used survey data on September $6^{\text {th }}$. The specifics of this survey data can be found below.

■ Weather: Nice and calm
■ Location: I-95 NB near exit 32

- Number of Total Lanes: 4
- Number of Closed Lanes: 2

■ Position: 2 right lanes closure

Figure(1). Location of Work Zone Area

The location of work zone area is shown in the Figure (1) and the geometry data is shown in the Table (1) and (2).

| Location | Symbol | Latitude | Longitude |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1st Lane Taper Start | A6 | 39 | 8.786 N | 76 | 50.559 W |
| 1st Lane Closure | B 6 | 39 | 8.914 N | 76 | 50.470 W |
| 2nd Lane Taper Start | C 6 | 39 | 9.135 N | 7650.306 W |  |
| 2nd Lane Closure | D6 | 39 | 9.236 N | 7650.197 W |  |
| Camcorder1 | CAM6 1 | 399.298 N | 7650.091 W |  |  |
| Camcorder2 | CAM6 2 | 398.778 N | 7650.586 W |  |  |
| Camcorder3 | CAM6 3 | 398.678 N | 7650.630 W |  |  |
| Camcorder4 | CAM6 4 | 398.239 N | 7650.950 W |  |  |

Table (1). Geometry Data

|  | Length <br> (feet) |
| :---: | :---: |
| A6_B6 | 874 |
| B6_C6 | 1548 |
| C6_D6 | 790 |
| D6_Camcorder1 | 627 |
| A6_Camcorder2 | 102 |
| A6_Camcorder3 | 725 |
| A6_Camcorder4 | 3794 |

Table (2). Geometry Data

I used data of the camcorder 4 for input flow. We have the number of cars and trucks that pass the camcorder 4 in each lane. I first calculated the 15 min flow, then, I converted to one hour flow. (Table (3),(4) \& (5))

| Time | Lane 1 |  | Lane 2 |  | Lane 3 |  | Lane 4 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table (5). Input Flow for the Model

## 3. Simulation of the Work Zone Area with CORSIM

## Software

I used the geometry data and input data from survey analysis to build the CORSIM model. The geometry of the model is shown in the Figure (2) and the model geometry data is shown in the Table (6).

Figure (2). Geometry of the Model

| Link\# | 1 | 2 | 3 | 4 | 5 | 6 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Length (ft) | 1794 | 1000 | 2074 | 2238 | 2000 | 2000 |
| Number of Lanes | 4 | 4 | 4 | 3 | 2 | 4 |
| Number of Dropped Lanes | 0 | 0 | 1 | 1 | 0 | 0 |
| Number of Added Lanes | 0 | 0 | 0 | 0 | 2 | 0 |
| Distance for Added or Dropped <br> Lanes from Upstream Node | - | - | 1874 | 2138 | 1980 | - |

Table (6). Model Geometry Data

## 4. Calibrate the CORSIM model to get similar results as real case data

For getting better results for the base case, I changed the Vehicle Entry Headway from Normal Distribution to Uniform Distribution and Erlang distribution with $\mathrm{a}=1$. The best results for the base case obtained by using Erlang distribution with $\mathrm{a}=1$. Therefore, I used this distribution for vehicle headway in my modeling.

For calibrating the model, I changed 3 parameters one by one and checked the CORSIM outputs with the survey data. These three parameters are:

- Free flow speed
- Rubberneck factor
- Car following factor

Also, I used the camcorder 1 and camcorder 3 data and also the queue length to calibrate the model.

The base case specifics and also the CORSIM output for camcorde1 and camcorder3 locations and queue length is shown in the Table (7), (8), (9) \& (10).

| Link\# | 1 | 2 | 3 | 4 | 5 | 6 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Free Flow Speed (mil/h) | 65 | 60 | 55 | 55 | 55 | 65 |
| Rubberneck Factor(\%) | 0 | 0 | 0 | 0 | 0 | 0 |
| Car Following Factor(\%) | 100 | 100 | 100 | 100 | 100 | 100 |

Table(7). Base Case Specifics

| Location(Camcorder1) |  |  |  |
| :---: | :---: | :---: | :---: |
| Time | Number of Vehicles |  | Error Percent |
|  | Corsim <br> Simulation | Survey <br> Data |  |
| 20:12-20:27 | 917 | 864 | 6.1 |
| $20: 27-20: 42$ | 889 | 842 | 5.6 |
| $20: 42-20: 57$ | 881 | 838 | 5.1 |

Table(8). Camcorder1 Location Comparison for the Base Case

| Location(Camcorder3) |  |  |  |
| :---: | :---: | :---: | :---: |
| Time | Number of Vehicles |  | Error Percent |
|  | Corsim Simulation | Survey Data |  |
| $19: 42-19: 57$ | 1154 | 1171 | -1.5 |
| $19: 57-20: 12$ | 832 | 938 | -11.3 |
| $20: 12-20: 27$ | 742 | 741 | 0.1 |
| $20: 27-20: 42$ | 735 | 746 | -1.5 |

Table(9). Camcorder3 Location Comparison for the Base Case

| Queue length from the transition start point |  |  |  |
| :---: | :---: | :---: | :---: |
| Time | Corsim Simulation <br> (feet) | Survey <br> Data (feet) | Error Percent |
| $20: 17$ | 2490 | 7006 | -64.5 |

Table(10). Queue Length Comparison for the Base Case

For the best case, Camcorder1 location data is acceptable but camcorder3 location data has one error more than 11 percent. The most important problem here is the queue length. So, I changed the mentioned parameters one by one. First I changed the free flow speed. The changing
in output in camcorde 3 location when the free flow speed is changed can be seen in the Table (11).

| Location Camcorder3 |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Time | Number of Vehicles (speed=55, change in link 3 rubberneck) |  |  |  |  |  |  |  |  |
|  | Survey Data | r.n. $=0$ | r.n. $=10$ | r.n. $=20$ | r.n. $=30$ | r.n. $=40$ | r.n. $=50$ | r.n. $=60$ | r.n. $=70$ |
| 19:42-19:57 | 1171 | 1154 | 1171 | 1073 | 1011 | 875 | 821 | Veh. <br> backed up | Veh. <br> Backed up |
| 19:57-20:12 | 938 | 832 | 850 | 853 | 896 | 849 | 778 |  |  |
| 20:12-20:27 | 741 | 742 | 778 | 811 | 861 | 851 | 777 |  |  |
| 20:27-20:42 | 746 | 735 | 698 | 711 | 716 | 788 | 760 |  |  |
| Error percentage |  |  |  |  |  |  |  |  |  |
|  |  | -1.5 | 0.0 | -8.4 | -13.7 | -25.3 | -29.9 |  |  |
|  |  | -11.3 | -9.4 | -9.1 | -4.5 | -9.5 | -17.1 |  |  |
|  |  | 0.1 | 5.0 | 9.4 | 16.2 | 14.8 | 4.9 |  |  |
|  |  | -1.5 | -6.4 | -4.7 | -4.0 | 5.6 | 1.9 |  |  |

Table (11). Camcorder3 Location Comparison for different Free Flow Speed

In the Table (11) it can be seen that the best results is for Free Flow Speed $=55$ mile $/$ hour.

For the camcorderl location the results for all of these free flow speeds are good but the queue length is still the most important problem and it is much different from the real case data. So, the best free flow speed is $55 \mathrm{mile} /$ hour and I chose this one.

Then I changed the Rubberneck factor in link 3, 4 and 5. The changing in rubberneck factor in link $4 \& 5$ did not give us good results. As you can see in the Table (12) rubberneck factor $=10 \%$ in link 3 gave the best results, so I chose this rubberneck factor for link3 but again the
big problem was the queue length.

| Location(Camcorder3) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Time | Number of Vehicles (speed=55, change in link 3 rubberneck) |  |  |  |  |  |  |  |  |
|  | Survey Data | r.n. $=0$ | r.n. $=10$ | r.n. $=20$ | r.n. $=30$ | r.n. $=40$ | r.n. $=50$ | r.n. $=60$ | r.n. $=70$ |
| 19:42-19:57 | 1171 | 1154 | 1171 | 1073 | 1011 | 875 | 821 | Veh. <br> backed <br> up | Veh. <br> Backed up |
| 19:57-20:12 | 938 | 832 | 850 | 853 | 896 | 849 | 778 |  |  |
| 20:12-20:27 | 741 | 742 | 778 | 811 | 861 | 851 | 777 |  |  |
| 20:27-20:42 | 746 | 735 | 698 | 711 | 716 | 788 | 760 |  |  |
| Error percentage |  |  |  |  |  |  |  |  |  |
|  |  | -1.5 | 0.0 | -8.4 | -13.7 | -25.3 | -29.9 |  |  |
|  |  | -11.3 | -9.4 | -9.1 | -4.5 | -9.5 | -17.1 |  |  |
|  |  | 0.1 | 5.0 | 9.4 | 16.2 | 14.8 | 4.9 |  |  |
|  |  | -1.5 | -6.4 | -4.7 | -4.0 | 5.6 | 1.9 |  |  |

Table (12). Camcorder3 Location Comparison for Different Rubberneck Factor in Link3

Then I used this rubberneck factor for link3 and again changed the free flow speed to see which one is better when the rubberneck factor in link 3 is $10 \%$. The results are shown in the Table (13) \& (14).

| Time | Number of Vehicles (in link 3 rubberneck=10\%) |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Survey <br> Data | Speed=65 | Speed=55 | error | Speed=45 | error | Speed=35 |
|  | 1171 | 1040 | 1171 | 0.0 | 1081 | -7.7 | 1064 |
| 19:57-20:12 | 938 | 781 | 850 | -9.4 | 934 | -0.4 | 850 |
| $20: 12-20: 27$ | 741 | 785 | 778 | 5.0 | 776 | 4.7 | 812 |
| $20: 27-20: 42$ | 746 | 739 | 698 | -6.4 | 719 | -3.6 | 717 |

Table (13). Camcorder3 Location Comparison for Different Free Flow Speeds When the Rubberneck Factor in Link 3 is $10 \%$

| Location(Camcorder1) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number of Vehicles ( in link 3 rubberneck $=10 \%$ ) |  |  |  |  |  |  |
| Time | Survey Data | Speed=65 | Speed=55 | error | Speed=45 | error | Speed=35 |
| 20:12-20:27 | 864 | 925 | 892 | 3.2 | 932 | 7.9 | 959 |
| 20:27-20:42 | 842 | 897 | 900 | 6.9 | 898 | 6.7 | 909 |
| 20:42-20:57 | 838 | 880 | 836 | -0.2 | 738 | -11.9 | 749 |

Table (14). Camcorder1 Location Comparison for Different Free Flow Speeds When the Rubberneck Factor in Link3 is 10\%

It is seen in the Table (13) \& (14) that the speed $=45 \& 55$ gives good results in camcorder3 location but in camcorder 1 location the 45 mile/hour speed has one error about $12 \%$. Therefore, I chose the 55 mile/hour for free flow speed. Again the queue length was the big problem.

Then, I changed the Car Following Factor in link 3, $4 \& 5$. Changing this factor in link $4 \& 5$ did not give good results, so I only bring the results for changing this factor in link3. (see the Table (15) \& (16))

| Time | Number of Vehicles ( speed=55 and in link 3 rubberneck=10\%) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Survey <br> Data | C.F.F=120 | error | C.F.F=140 | error | C.F.F=150 | error | C.F.F=160 | error |  |
| $9: 42-19: 57$ | 1171 | 1051 | -10.2 | 1005 | -14.2 | 1047 | -10.6 | 968 | -17.3 |  |
| $9: 57-20: 12$ | 938 | 834 | -11.1 | 927 | -1.2 | 931 | -0.7 | 922 | -1.7 |  |
| $0: 12-20: 27$ | 741 | 835 | 12.7 | 937 | 26.5 | 927 | 25.1 | 892 | 20.4 |  |
| $0: 27-20: 42$ | 746 | 768 | 2.9 | 747 | 0.1 | 753 | 0.9 | 839 | 12.5 |  |
| lueue(feet) | 7006 | 5706 | -18.6 | 5806 | -17.1 | 5756 | -17.8 | 6279 | -10.4 |  |

Table (15). Camcorder3 Location and Queue Length Comparison for Different Car
Following Factors

| Number of Vehicles (speed=55 and in link 3rubberneck=10\%) |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Time |  |  |  |  |  |  |  |  |  |  |
|  | Survey <br> Data | C.F.F=120 | error | C.F.F $=140$ | error | C.F.F=150 | error | C.F.F=160 | error |  |
| $20: 12-20: 27$ | 864 | 931 | 7.8 | 983 | 13.8 | 973 | 12.6 | 921 | 6.6 |  |
| $20: 27-20: 42$ | 842 | 874 | 3.8 | 917 | 8.9 | 914 | 8.6 | 947 | 12.5 |  |
| $20: 42-20: 57$ | 838 | 878 | 4.8 | 695 | -17.1 | 694 | -17.2 | 797 | -4.9 |  |

Table (16). Camcorder1 Location Comparison for Different Car Following Factors

In the Table (15) \& (16), it is seen that the best queue length is for C.F.F $=160$ in link3, but the camcorder1\&3 location data are not in acceptable range of error. Because the queue length in this situation is the best one I could find so far, I decided to choose this C.F.F for link 3 and change the rubberneck factor in the links to get good results for the camcorder $1 \& 3$ location data.

After changing the rubberneck factor in link $3,4 \& 5$, I also checked the combination of them. In addition, I used the changing rubberneck factor by time in a link. The situation of the best results is shown in the Table (17).

| Link\# | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ |  | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Free Flow Speed (mile/h) | 65 | 60 | 55 |  | 55 | 55 | 65 |
| Rubberneck Factor(\%) | 0 | 0 | 10 | 50 | 2 | 0 | 0 |
| Time of Onset(sec) |  |  | 300 | 900 | 1500 |  |  |
| Car Following Factor(\%) | 100 | 100 | 160 |  | 100 | 100 | 100 |

Table (17). The Model Parameters for the Best Results

It is seen in the Table (17) that the Free Flow Speed is the same as the base case and the Car Following Factor is 160 for link3 and 100 for other links. The Rubberneck Factor is zero in all links at the beginning but after $300 \sec (5-\mathrm{min})$ it changes to $10 \%$ in link 3 and after $900 \sec (15-\mathrm{min})$ another $50 \%$ Rubberneck Factor is added to link3. Furthermore, after $1500 \sec (25-\mathrm{min})$ the Rubberneck Factor in link4 becomes $2 \%$.

The results of this situation are shown in the Table (18) \& (19).

| Location(Camcorder3) |  |  |  |
| :---: | :---: | :---: | :---: |
| Time | Number of Vehicles for the Best Situation |  |  |
|  | Survey Data | CORSIM | error |
| $\mathbf{1 9 : 4 2 - 1 9 : 5 7}$ | 1171 | 1087 | -7.2 |
| $\mathbf{1 9 : 5 7 - 2 0 : 1 2}$ | 938 | 847 | -9.7 |
| $\mathbf{2 0 : 1 2 - 2 0 : 2 7}$ | 741 | 766 | 3.4 |
| $\mathbf{2 0 : 2 7 - 2 0 : 4 2}$ | 746 | 739 | -0.9 |
| Queue Length (feet) | 7006 | 6119 | -12.7 |

Table (18). Camcorder3 Location and Queue Length Comparison for the Best Situation

| Location(Camcorder1) |  |  |  |
| :---: | :---: | :---: | :---: |
| Time | Number of Vehicles for the Best Situation |  |  |
|  | Survey Data | CORSIM | error |
|  | 864 | 790 | -8.6 |
| $\mathbf{2 0 : 2 7 - 2 0 : 4 2}$ | 842 | 775 | -8.0 |
| $\mathbf{2 0 : 4 2 - 2 0 : 5 7}$ | 838 | 787 | -6.1 |

Table (19). Camcorder 1 Location Comparison for the Best Situation

In the Table (18) \& (19), it is seen that the results have acceptable errors.

## 5. Estimating the Max Capacity

I used $9 \%$ truck percentage (the same as survey data) and $25 \%$ of input flow in each lane and changed the input flow from $6400 \mathrm{veh} / \mathrm{h}$ to $3200 \mathrm{veh} / \mathrm{h}$ to find the max throughput. Also, it could be seen that in which flow the queue disappeared. I ran the CORSIM with 6 random seed numbers for each input flow and got the mean throughput of these data. Then, I calculated the standard deviation for throughputs and by dividing the standard deviation of throughputs by mean throughput, it can be seen that this amount for all input flows is less than $7 \%$, so the results are acceptable. The mean throughput and queue condition for different input flows are shown in the Table(20).

|  | Location(Camcorder1) | Location(Camcorder3) |  |
| :---: | :---: | :---: | :---: |
| Input <br> (vehicle/hour) | Number of <br> Throughput <br> Vehicle/hour/lane | Number of <br> Throughput <br> Vehicle/hour/lane | Queue <br> Condition |
| $\mathbf{6 4 0 0}$ | 1569 | 775 | Queue |
| $\mathbf{6 0 0 0}$ | 1610 | 795 | Queue |
| $\mathbf{5 6 0 0}$ | 1618 | 801 | Queue |

| $\mathbf{3 5 0 0}$ | 1750 | 874 | No Queue |
| $\mathbf{3 4 0 0}$ | 1700 | 849 | No Queue |
| $\mathbf{3 2 0 0}$ | 1599 | 799 | No Queue |

Table(20). Mean Throughput and Queue Condition for Different Input Flows

It can be seen in the Table (20) that the max throughput in both locations (camcorder $1 \& 3$ locations) takes place at the same input flow (3600 veh/hour). Also, this flow is exactly when the queue disappears.

The standard deviation of throughputs divided by mean throughput for different input flows is shown in the Table (21). All of the numbers are below $7 \%$ and it shows that our results are good.

|  | Location(Camcorder1) | Location(Camcorder3) |
| :---: | :---: | :---: |
| Input <br> (vehicle/hour) | Standard Deviation/Mean \% | Standard Deviation/Mean \% |
| $\mathbf{6 4 0 0}$ | 1.3 | 1.7 |
| $\mathbf{6 0 0 0}$ | 4.8 | 4.7 |
| $\mathbf{5 6 0 0}$ | 3.2 | 3.3 |
| $\mathbf{5 2 0 0}$ | 6.4 | 6.5 |
| $\mathbf{4 8 0 0}$ | 2.3 | 2.8 |

Table(34). Throughputs in Camcorder $1 \& 3$ Locations versus Different Input Flows for 50\% Truck Percentage

The graph of the throughputs in camcorder1 location is shown in Figure (7) and the graph for camcorder3 location is shown in Figure (8).

Figure(7). Throughput in Camcorder1 Location versus Input Flow for Different Truck
Percentages (for 1 Lane Closure)

Figure(8). Throughput in Camcorder3 Location versus Input Flow for Different Truck
Percentages (for 1 Lane Closure)

Max throughput in Camcorder 3 Location for different truck percentages are shown in Table(35) and the graph is shown in Figure(9).

| Percentage of <br> Trucks | Max Number of <br> Throughput in <br> Camcorder 3 location <br> (Vehicle/hour/lane) |
| :---: | :---: |
| $\mathbf{5 \%}$ Truck | 1011 |
| $\mathbf{1 0 \%}$ Truck | 999 |
| $\mathbf{2 0 \%}$ Truck | 950 |
| $\mathbf{3 0 \%}$ Truck | 912 |
| $\mathbf{4 0 \%}$ Truck | 887 |
| $\mathbf{5 0 \%}$ Truck | 874 |

Table(35). Max Throughput in Camcorder3 Location for Different Truck Percentages (for 1Lane Closure)

Figure(9). Max Throughput in Camcorder3 Location for Different Truck Percentages (for 1 Lane Closure)

The comparison of max throughput in camcorder3 location for 1- lane closure and 2- lane closure for different truck percentages can be seen in Table(36) and Figure(10).

| Percentage of Trucks | Max Number of <br> Camcorder 3 location <br> (Vehicle/hour/lane) |  |
| :---: | :---: | :---: |
|  | 2 lane closure(4-2) | 1 lane closure(4-3) |
| $5 \%$ Truck | 938 | 1011 |
| $10 \%$ Truck | 900 | 999 |
| $20 \%$ Truck | 824 | 950 |
| $30 \%$ Truck | 776 | 912 |
| $40 \%$ Truck | 743 | 887 |
| $50 \%$ Truck | 692 | 874 |

Table(36). Comparison of Max Throughput in Camcorder3 Location for Different Truck Percentages for 1Lane \& 2Lane Closure

Figure(10). Comparison of Max Throughput in Camcorder3 Location for Different Truck Percentages for 1 Lane \& 2 Lane Closure

## 8. Conclusion

It can be seen in the results that max throughput in both locations takes place with the same input flow and also the max throughput happens exactly before queue starts. As it was obvious, by increasing the truck percentage the max throughput decreases.

In addition, the max throughput in camcorder3 location is higher when only one lane is closed in comparison with 2 lane closure throughput.

Decreasing in camcorder1 location throughput for 1 lane closure in comparison with 2 lane closure is because of limitation in camcorder3 location throughput (for example for $5 \%$ truck percentage the max throughput in camcorder3 location is $1011 \mathrm{veh} / \mathrm{h} /$ lane and there are

4lanes so the total numbers of throughput is 4044 . These vehicles should pass through 3 lanes, therefore the max throughput in camcorder1 location is 1345).
