LANE USE FACTOR ESTIMATION FOR INTERSECTIONS WITH LANE DROP

Park \& Kevin

## OUTLINE

- Introduction
- Literature review
- Lane drop types
- Data collection
- Data analysis and proposed LUF
- Summary

## INTRODUCTION

- What is LUF (Lane Use Factor)
- The ratio of the highest lane volume over the total volume in a lane group
- Used to determine the critical lane volume for signal phase or intersection analysis
- Currently used LUF ( from HCM 2000 )

| Number of approach lanes | Lane use factor |
| :---: | :---: |
| 1 | 1 |
| 2 | 0.55 |
| 3 | 0.4 |
| 4 | 0.3 |
| 5 | 0.24 |
| Double left turns | 0.6 |
| Triple left turns | 0.45 |

## INTRODUCTION

- Lane drop intersection types
- Merge
- One of the lanes has to merge after the intersection
- Form a Single Iane (Alternative Merge)
- The two lanes merge each other without indication of which lane yields the right-of-way.
- Are the LUFs for intersection without lane drop and intersection with lane drop be the same?
- If the LUFs are different from normal LUF, what will be the values?

## LITERATURE REVIEW

- Nanda Srinivasan (2011) from NCHRP focused on auxiliary through lanes to estimated the volume. (TRB)
- However, the estimated model used signal information; the lane use factor is still unknown for the many types of lane drop.
- Jae-Joon Lee, Nagui M. Rouphail, and Joseph E. Hummer (2005) from North Carolina University developed a set of field-verified estimates for the lane utilization factor. (NCDOT project)
- However, the lane utilization factor was a different concept from the lane use factor focused in this research; the field data was collected in North Carolina state only, which may not be in Maryland.

## LITERATURE REVIEW

- Difference between LUF and Iane utilization factor

$$
\begin{align*}
& \mathbf{L U F}=\mathrm{v} \downarrow g l / \mathrm{v} \downarrow g  \tag{1}\\
& \text { where } \mathrm{v} \downarrow g=\text { total lane flow rate (vph); } \\
& \mathrm{v} \downarrow g l=\text { highest lane flow rate in a lane group (vph). }
\end{align*}
$$

Lane utilization factor $=\mathrm{v} \downarrow g / v \downarrow g l N$
where $\mathrm{v} \downarrow g=$ total lane flow rate for the lane group (veh/h)
$\mathrm{v} \downarrow \mathrm{g} l=$ highest lane flow rate in a lane group (vph)
$N=$ number of lanes in lane group
(Jae-Joon Lee, Nagui M. Rouphail, and Joseph E. Hummer 2005)

- The LUF can be obtained by the lane utilization factor by:
$\mathbf{L U F}=\mathbf{1} /(\mathbf{N}$ * Lane utilization factor)
Where $N=$ number of lanes in lane group
- So this study will test whether the models from NC university can fit the field data from Maryland.

## LANE DROP TYPES

- 5 lane drop types have been studied
(1). Two through lanes with one lane drop
(2). Three through lanes with one lane drop
(3). Double left turn lanes with one lane drop

(4). Two through lanes form a single lane
(5). Double left turn lanes form a single lane

## DATA COLLECTION

- 29 different sites in Maryland
- Over 130 hours traffic data
- AM peak, PM peak and off-peak hours in weekdays

| Types | No. of <br> locations | No. of data group (\# <br> of 15 min$)$ |
| :---: | :---: | :---: |
| 3 through $\boldsymbol{\rightarrow} \mathbf{2}$ | 6 | 71 |
| 2 through $\rightarrow \mathbf{1}$ <br> (exclusive) | 10 | 251 |
| 2 left $\boldsymbol{\rightarrow} \mathbf{1}$ | 8 | 148 |
| 2 through "form a |  |  |
| single lane" |  |  |

## DATA ANALYSIS AND PROPOSED LUF

- Data analysis methods
- 1. Boxplot
- Examine the outliers;
- 2.Statistical test
- Compared with the normal LUF;
- Compared with the estimation of models from NC university(if exist);
- 3. Scatter plot
- Observe patterns with possible factors;
- 4. Categorize data based on the identified factors if necessary
- 5. Provide suggested LUF

## DATA ANALYSIS AND PROPOSED LUF

Type 1: 2 through - 1

- Example:
- MD 650 @ Spenceville Road
- Right most lane merge into left lane after 850 feet from the intersection

## DATA ANALYSIS AND PROPOSED LUF

Type 1: 2 through - 1

- 10 Locations
- Spenceville Rd(MD 28) \& Norbeck Rd (MD 650) @ Montgomery
- North bound and west bound
- Norback Rd (MD 28) \& Georgia Ave (MD 97) @ Montgomery
- Enterprise Rd (MD 193) \& Annapolis Rd (MD 450) @ Prince George
- Bel Air Rd (US 1) \& Mountain Rd (MD 152) @ Harford
- Greenbelt Rd (MD 193) \& Lanham Severn Rd (MD 564) @ Prince George
- East bound and west bound
- Queens Chapel Rd (MD 500) \& Hamilton St (MD 208) @ Prince George
- Hamilton St (MD 208) \& Ager Rd @ Prince George
- Watkins Park Dr (MD 193) \& Central Ave (MD 214)

## DATA ANALYSIS AND PROPOSED LUF

Type 1: 2 through - 1

- 1. Boxplot

| Sample size | 227 |
| :---: | :---: |
| Median | 0.610 |
| Minimum | 0.500 |
| Maximum | 0.792 |
| First quartile | 0.573 |
| Third quartile | 0.651 |
|  | 0.7920 .7580 .7580 .7420 .7410 .737 |
| Outliers (8) | 0.7290 .729 |
|  |  |

- LUFs are mainly located between 0.57 and 0.65 .

## DATA ANALYSIS AND PROPOSED LUF

## Type 1: 2 through - 1

- 2. Compared with normal LUF
- Descriptive statistics

| Descriptive statistics | LUF from field survey |
| :---: | :---: |
| Mean | 0.613 |
| Standard Error | 0.0035 |
| Median | 0.60 |
| Standard Deviation | 0.052 |
| Sample Variance | 0.0027 |
| Range | 0.23 |
| Minimum | 0.50 |
| Maximum | 0.73 |
| Count | 219 |
| Confidence Level(95.0\%) | 0.0069 |

- Test the difference:
- HO: The mean of LUF from field survey is the same as normal LUF for two lanes (0.55);
- H1: The mean of LUF from field survey is not the same as normal LUF for two lanes ( 0.55 );
- Result:
- T-test: 17.075
- P value<0.0001
- Reject HO
- Conclusion:
- The difference is statistically significant
- Normal LUF is not suitable for this type of lane drop intersection

## DATA ANALYSIS AND PROPOSED LUF

## Type 1: 2 through - 1

- 3. Test the model from NC University
$L U F=1 / 2 * 0.5435 * e \uparrow(0.1782$ Short $K$ +0.6273AvglInvolK -0.1047 $N \downarrow$ sign )

| Descriptive statistics | Lane use factor from field <br> survey | Lane use factor from the <br> model |
| :---: | :---: | :---: |
| Mean | 0.613 | 0.782 |
| Standard Error | 0.0035 | 0.004 |
| Median | 0.60 | 0.768 |
| Standard Deviation | 0.052 | 0.058 |
| Sample Variance | 0.0027 | 0.003 |
| Range | 0.23 | 0.237 |
| Minimum | 0.50 | 0.659 |
| Maximum | 0.73 | 0.897 |
| Count | 219 | 219 |
| Confidence Level(95.0\%) | 0.0069 | 0.008 |

- Test the difference:
- HO: The means of two data groups are the same;
- H1: The means of two data groups are not the same;
- Result:
- T-test: 32.296
- P value<0.0001
- Reject HO
- Conclusion:
- The difference is statistically significant
- The model is not suitable for the data from field survey

## DATA ANALYSIS AND PROPOSED LUF

Type 1: 2 through - 1

- 4. Scatter plot
- (LUF vs. total volume): increases, LUF decreases; Most LUFs are

LUF VS. Total volume

LUF

## DATA ANALYSIS AND PROPOSED LUF

Type 1: 2 through - 1

- 4. Scatter plot
- (LUF vs. Iength of Iane drop):

## DATA ANALYSIS AND PROPOSED LUF

Type 1: 2 through - 1

- 5. Divide the data according to different volume range
- Most LUF<0.65, when volume>600;
- Ranges: less than 600vph; more than 600vph.

## DATA ANALYSIS AND PROPOSED LUF

## Type 1: 2 through - 1

- 5. Divide the data according to
different volume range
- Compare LUFs between ranges

| Descriptive statistics | Total volume: <br> 0-600vph | Total volume: <br> over 600vph |
| :---: | :---: | :---: |
| Mean | 0.620 | 0.592 |
| Standard Error | 0.004 | 0.007 |
| Median | 0.610 | 0.591 |
| Standard Deviation | 0.053 | 0.029 |
| Sample Variance | 0.003 | 0.001 |
| Range | 0.227 | 0.100 |
| Minimum | 0.500 | 0.544 |
| Maximum | 0.727 | 0.644 |
| Count | 201 | 18 |
| Confidence Level(95.0\%) | 0.007 | 0.015 |
| Confident interval for mean | $(0.613,0.627)$ | $(0.577,0.607)$ |

- Test the difference:
- HO: The means of LUFs in two volume ranges are the same;
- H1: The means of LUFs in two volume ranges are not the same;
- Result:
- T-test: 2.209
- $P$ value $=0.028<0.05$
- Reject HO
- Conclusion:
- The difference is statistically significant
- Based on approach volume, two LUFs are suggested

## DATA ANALYSIS AND PROPOSED LUF

Type 1: 2 through - 1
6. Conclusion

- Suggested lane use factor for two lanes with one lane drop:

| Total volume | Less than 600 vph | More than 600 vph |
| :---: | :---: | :---: |
| Lane use factor | 0.62 | 0.59 |
| Normal lane use factor for two lanes | 0.55 |  |

## DATA ANALYSIS AND PROPOSED LUF

Type 2: 3 through - 2

- Example:
- MD 450 @ Fairwood Parkway
- Right most lane merge to center lane after 900 ft from the intersection

## DATA ANALYSIS AND PROPOSED LUF

## Type 2: 3 through - 2

- 6 Locations
- Annapolis Rd (MD 450) \& Fairwood Pkwy @ Prince George
- Baltimore Ave (US 1) \& South Dr @ Prince George
- Campus Way S (MD 977H) \& Largo Rd (MD 202) @ Prince George
- Campus Way S \& Central Ave (MD 214) @ Prince George
- Iverson St (MD 458)\& Branch Ave (MD 5) @ Prince George
- Adelphi Rd \& University Blvd (MD 193) @ Prince George

## DATA ANALYSIS AND PROPOSED LUF

## Type 2: 3 through - 2

- 1. Boxplot

| Sample size | 71 |
| :---: | :---: |
| Median | 0.427 |
| Minimum | 0.369 |
| Maximum | 0.525 |
| First quartile | 0.403 |
| Third quartile | 0.455 |
| Outilers(1) | 0.525 |

- Most LUFs are located between 0.4 and o. 45

## DATA ANALYSIS AND PROPOSED LUF

## Type 2: 3 through - 2

- 2. Compared with normal LUF
- Descriptive statistics

| Descriptive statistics | LUF from field survey |
| :---: | :---: |
| Mean | 0.430 |
| Standard Error | 0.004 |
| Median | 0.427 |
| Standard Deviation | 0.031 |
| Sample Variance | 0.001 |
| Range | 0.136 |
| Minimum | 0.369 |
| Maximum | 0.505 |
| Count | 70 |
| Confidence Level(95.0\%) | 0.008 |

- Test the difference:
- HO: The mean of LUF from field survey is the same as normal LUF for three lanes (0.4);
- H1: The mean of LUF from field survey is not the same as normal LUF for three lanes (0.4);
- Result:
o T-test: 8.097
- P value<0.0001
- Reject HO
- Conclusion:
- The difference is statistically significant
- Normal LUF is not suitable for this type of lane drop intersection

## DATA ANALYSIS AND PROPOSED LUF

Type 2: 3 through - 2

- 3. Test the model from NC University

$$
\begin{aligned}
& L U F=1 / 3 *(0.4033+0.2814 \text { ShortK } \\
& +0.0576 * A v g \downarrow \text { InvloK })
\end{aligned}
$$

| Shart\%: Shartlanelanoth (ft) |  |  |
| :---: | :---: | :---: |
| Descriptive statistios | Lane use factor from field survey | Lane use factor from the model |
| Mean | 0.430 | 0.471 |
| Standard Error | 0.004 | 0.004 |
| Median | 0.427 | 0.470 |
| Standard Deviation | 0.031 | 0.033 |
| Sample Variance | 0.001 | 0.001 |
| Range | 0.136 | 0.118 |
| Minimum | 0.369 | 0.402 |
| Maximum | 0.505 | 0.520 |
| Count | 70 | 70 |
| Confidence Level(95.0\%) | 0.008 | 0.008 |

- Test the difference:
- HO: The means of two data groups are the same;
- H1: The means of two data groups are not the same;
- Result:

○ T-test: 7.576

- P value<0.0001
- Reject HO
- Conclusion:
- The difference is statistically significant
- The model is not suitable for the LUF from field survey

## DATA ANALYSIS AND PROPOSED LUF

## Type 2: 3 through - 2

- 4. Scatter plot
- (LUF vs. total volume):

LUF VS. Total volume
Most LUFs are between 0.4 and 0.5; no obvious trend observed.

## DATA ANALYSIS AND PROPOSED LUF

## Type 2: 3 through - 2

- 4. Scatter plot
- (LUF vs. length of Iane drop):

## DATA ANALYSIS AND PROPOSED LUF

Type 2: 3 through - 2

- Since the data in the scatter plots does not depend on factors (volume and distance to neighboring intersection), the data is not further categorized
- 6. Conclusion
- Suggested lane use factor for two lanes with one lane drop:

| Suggested lane use factor | 0.43 |
| :---: | :---: |
| Normal lane use factor for three lanes | 0.4 |

## DATA ANALYSIS AND PROPOSED LUF

Type 3: 2 left- 1

- Example:
- Enterprise Road @ Annapolis Road
- Right lane merge to left lane after 640 feet from intersection

## DATA ANALYSIS AND PROPOSED LUF

## Type 3: 2 left- 1

- 8 Locations
- Paint Branch Dr \& University Blvd (MD 193) @ Prince George
- Baltimore Ave (US 1) \& Contee Rd @ Prince George
- Norback Rd (MD 28) \& Georgia Ave (MD 97) @ Montgomery
- Enterprise Rd (MD 193) \& Annapolis Rd (MD 450) @ Prince George
- Bel Air Rd (US 1) \& Mountain Rd (MD 152) @ Harford
- Greenbelt Rd (MD 193) \& Lanham Severn Rd (MD 564) @ Prince George
- North bound and south bound
- Watkins Park Dr (MD 193) \& Central Ave (MD 214)

## DATA ANALYSIS AND PROPOSED LUF

Type 3: 2 left- 1
-1. Boxplot

| Sample size | 148 |
| :---: | :---: |
| Median | 0.590 |
| Minimum | 0.500 |
| Maximum | 0.825 |
| First quartile | 0.546 |
| Third quartile | 0.630 |
| Outliers (10) | 0.825 |
| 0.8180 .8160 .800 | 0.7930 .778 |

- Outliers happen when the volume is low (less than 200 vph), the LUF becomes fluctuated when the volume is low.

## DATA ANALYSIS AND PROPOSED LUF

## Type 3: 2 left- 1

- 2. Compared with normal LUF
- Descriptive statistics

| Descriptive statistics | LUF from field survey |
| :---: | :---: |
| Mean | 0.586 |
| Standard Error | 0.004 |
| Median | 0.585 |
| Standard Deviation | 0.052 |
| Sample Variance | 0.003 |
| Range | 0.234 |
| Minimum | 0.500 |
| Maximum | 0.716 |
| Count | 138 |
| Confidence Level(95.0\%) | 0.009 |

- Test the difference:
- HO: The mean of LUF from field survey is the same as normal LUF for double left turns(0.6);
- H1: The mean of LUF from field survey is not the same as normal LUF for double left turns(0.6);
- Result:
o T-test: 3.163
- P value=0.0017<0.05
- Reject H0
- Conclusion:
- The difference is statistically significant
- Normal LUF is not suitable for this type of lane drop intersection

## DATA ANALYSIS AND PROPOSED LUF

Type 3: 2 left- 1

- 3. Test the model from NC University
$L U F=1 / 2 *(0.6161+0.8636 * A v g \downarrow I n v l o K)$
Where $\boldsymbol{A} \boldsymbol{v} \boldsymbol{g} \downarrow \boldsymbol{I n v o l K}:$ Average lane volume (vphpl) $\div 1000$;

| Descriptive statistios | Lane use factor from field <br> survey | Lane use factor from the <br> model |
| :---: | :---: | :---: |
| Mean | 0.586 | 0.707 |
| Standard Error | 0.004 | 0.003 |
| Median | 0.585 | 0.714 |
| Standard Deviation | 0.052 | 0.037 |
| Sample Variance | 0.003 | 0.001 |
| Range | 0.234 | 0.169 |
| Minimum | 0.482 | 0.607 |
| Maximum | 0.716 | 0.777 |
| Count | 138 | 138 |
| Confidence Level(95.0\%) | 0.009 | 0.006 |

- Test the difference:
- HO: The means of two data groups are the same;
- H1: The means of two data groups are not the same;
- Result:
- T-test: 22.273
- P value<0.0001
- Reject HO
- Conclusion:
- The difference is statistically significant
- The model is not suitable for the LUF from field survey

## DATA ANALYSIS AND PROPOSED LUF

Type 3: 2 left- 1

- 4. Scatter plot
" (LUF vs. total volume):

Total volume increases, the LUF decreases. Data points are settled around 0.6

Current LUF: 0.6 Normal intersection

LUF

## DATA ANALYSIS AND PROPOSED LUF

Type 3: 2 left- 1

- 4. Scatter plot
- (LUF vs. Iength of lane drop):

## DATA ANALYSIS AND PROPOSED LUF

Type 3: 2 left- 1
5. Divide the data according to different volume range

- Most LUF<0.60, when volume>300;
- Ranges: less than 300vph; more than 300vph.

## DATA ANALYSIS AND PROPOSED LUF

Type 3: 2 left- 1

- 5. Divide the data according to different volume range
- Compare LUFs between ranges

| Descriptive statistics | Total volume: <br> 0-600vph | Total volume: <br> over 600vph |
| :---: | :---: | :---: |
| Mean | 0.591 | 0.564 |
| Standard Error | 0.005 | 0.006 |
| Median | 0.591 | 0.564 |
| Standard Deviation | 0.055 | 0.030 |
| Sample Variance | 0.003 | 0.001 |
| Range | 0.234 | 0.108 |
| Minimum | 0.500 | 0.513 |
| Maximum | 0.716 | 0.621 |
| Count | 113 | 25 |
| Confidence Level(95.0\%) | 0.010 | 0.012 |
| Confident interval for mean | $(0.581,0.601)$ | $(0.552,0.576)$ |

- Test the difference:
- HO: The means of two volume ranges are the same;
- H1: The means of two volume ranges are not the same;
Result:
o T-test: 23.1
- P value<0.0001
- Reject HO

Conclusion:

- The difference is statistically significant
- Based on approach volume, two LUFs are suggested

## DATA ANALYSIS AND PROPOSED LUF

Type 3: 2 left- 1

- 5. Divide the data according

## to different volume range.

- Since the LUF when volume is less than 300 vph is close to normal LUF, compare their difference.

| Descriptive statistics | LUF when volume < 300 vph |
| :---: | :---: |
| Mean | 0.591 |
| Standard Error | 0.005 |
| Median | 0.591 |
| Standard Deviation | 0.055 |
| Sample Variance | 0.003 |
| Range | 0.234 |
| Minimum | 0.500 |
| Maximum | 0.716 |
| Count | 113 |
| Confidence Level(9.5.0\%) | 0.010 |

- Test the difference:
- HO: The mean of LUF when volume is less than 300 vph is the same as normal LUF for double left turns(0.6);
- H1: The mean of LUF when volume is less than 300 vph is not the same as normal LUF for double left turns(0.6);
- Result:
o T-test: 1.74
- $P$ value $=0.083>0.05$
- Not reject HO
- Conclusion:
- The difference is not statistically significant
- Normal LUF is suitable for this type of lane drop intersection when volume is less than 300 vph.

## DATA ANALYSIS AND PROPOSED LUF

## Type 3: 2 left- 1

6. Conclusion

- Suggested lane use factor for two lanes with one lane drop:

| Total volume | Less than 300 vph | More than 300 vph |
| :---: | :---: | :---: |
| Lane use factor | 0.60 | 0.56 |
| Normal lane use factor for two lanes | 0.60 |  |

- Different from other situations, the LUF is less than normal LUF.

## DATA ANALYSIS AND PROPOSED LUF

## Type 3: 2 left- 1

- Possible reasons:
- Double left turns at normal intersection
- Outer lane volume is higher;
- Double left turns with lane drop
- Inner lane volume is higher (this pattern is observed while collecting data);

## DATA ANALYSIS AND PROPOSED LUF

Type 4: 2 through form a single lane

- Example:
- MD 650 @ MD 410
- Form a single lane after 200 feet from the intersection

## DATA ANALYSIS AND PROPOSED LUF

## Type 4: 2 through form a single lane

- 3 Locations
- Ritchie Rd at Walker Mill Rd @ Prince George
- Ethan Allen Ave (MD 410) \& New Hampshire Ave (MD 650) @ Prince George
- Spencerville Rd(MD 28) \& Norbeck Rd (MD 650) @ Montgomery

## DATA ANALYSIS AND PROPOSED LUF

## Type 4: 2 through form a single lane

- 1. Boxplot

| Sample size | 45 |
| :---: | :---: |
| Median | 0.538 |
| Minimum | 0.500 |
| Maximum | 0.653 |
| First quartile | 0.526 |
| Third quartile | 0.558 |
| Outliers (5) | 0.6530 .6520 .6450 .5920 .592 |

- Most LUFs are located between 0.53 and 0.56

## DATA ANALYSIS AND PROPOSED LUF

## Type 4: 2 through form a single lane

- 2. Compared with normal LUF
- Descriptive statistics

| Descriptive statistics | LUF from fleld survey |
| :---: | :---: |
| Mean | 0.543 |
| Standard Error | 0.003 |
| Median | 0.537 |
| Standard Deviation | 0.023 |
| Sample Variance | 0.0004 |
| Range | 0.082 |
| Minimum | 0.500 |
| Maximum | 0.582 |
| Count | 40 |
| Confidence Level(95.0\%) | 0.01 |

- Test the difference:
- HO: The mean of LUF from field survey is the same as normal LUF for two lanes(0.55);
- H1: The mean of LUF from field survey is not the same as normal LUF for two lanes ( 0.55 );
- Result:
- T-test: 1.925
- P value=0.058>0.05
- Not reject H0
- Conclusion:
- The difference is not statistically significant

## DATA ANALYSIS AND PROPOSED LUF

## Type 4: 2 through form a single lane

- 3. Scatter plot
- (LUF vs. total volume):

The LUF does not change over different volume level (0.55)
LUF VS. Total volume

UF

## DATA ANALYSIS AND PROPOSED LUF

## Type 4: 2 through form a single lane

4. Conclusion

- LUFs from field survey are stable;
- The mean of the LUF from field survey is not statistically different from the normal LUF.
- No changes on LUF for two lanes form a single lane:

| Suggested lane use factor | 0.55 |
| :---: | :--- |
| Normal lane use factor for three lanes | 0.55 |

## DATA ANALYSIS AND PROPOSED LUF

Type 5: 2 left form a single lane

- Example:
- Montrose Parkway @ MD 355
- Alternate merging after 350 feet from the intersection

## DATA ANALYSIS AND PROPOSED LUF

## Type 5: 2 left form a single lane

- 2 Locations
- Martin Luther King Jr Hwy (MD 704) \& John Hanson Hwy (US 50) @ Prince George
- Rockville Pike (MD 355) \& Montrose Pkwy @ Montgomery

## DATA ANALYSIS AND PROPOSED LUF

Type 5: 2 left form a single lane

- 1. Boxplot

| Sample size | 44 |
| :---: | :---: |
| Median | 0.545 |
| Minimum | 0.500 |
| Maximum | 0.625 |
| First quartile | 0.524 |
| Third quartile | 0.576 |
| Outliers $(5)$ | 0.625 |

- Most LUFs are located between 0.52 and 0.58

## DATA ANALYSIS AND PROPOSED LUF

## Type 5: 2 left form a single lane

- 2. Compared with normal LUF
- Descriptive statistics

| Descriptive statistics | LUF from field survey |
| :---: | :---: |
| Mean | 0.549 |
| Standard Error | 0.0049 |
| Median | 0.543 |
| Standard Deviation | 0.032 |
| Sample Variance | 0.001 |
| Range | 0.121 |
| Minimum | 0.500 |
| Maximum | 0.621 |
| Count | 43 |
| Confidence Level(95.0\%) | 0.010 |

- Test the difference:
- HO: The mean of LUF from field survey is the same as normal LUF for two lanes(0.60);
- H1: The mean of LUF from field survey is not the same as normal LUF for two lanes ( 0.60 );
- Result:
o T-test: 10.451
- P value<0.0001
- Reject HO
- Conclusion:
- The difference is statistically significant
- Normal LUF is not suitable for this type of lane drop intersection

## DATA ANALYSIS AND PROPOSED LUF

## Type 5: 2 left form a single lane

- 3. Scatter plot
- (LUF vs. total volume):

LUFs are scattered between 0.5 and 0.6.
No obvious trend is
LUF VS. Total volume

## DATA ANALYSIS AND PROPOSED LUF

## Type 5: 2 left form a single lane

4. Conclusion

- LUFs from field survey are stable;
- The mean of the LUF from field survey is statistically different from the normal LUF.
- Suggested lane use factor for two lanes form single Iane:

| Suggested lane use factor | 0.55 |
| :---: | :---: |
| Normal lane use factor for three lanes | 0.6 |

## SUMMARY

## - Suggested lane use factor values with lane drop conditions:

| Types | Minimum | Maximum | Suggested LUF value |  | Current LUF value |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 3 through $\rightarrow$ 2 | 0.37 | 0.51 | 0.43 |  | 0.40 |
| 2 through $\rightarrow 1$ (exclusive) | 0.50 | 0.73 | Total volume Less than 600 vph | 0.62 | 0.55 |
|  | 0.54 | 0.64 | Total volume More than 600 vph | 0.59 |  |
| 2 left $\rightarrow 1$ | 0.50 | 0.72 | Total volume Less than 300 vph | 0.60 | 0.60 |
|  | 0.51 | 0.62 | Total volume More than 300 vph | 0.56 |  |
| 2 through "form a single lane" | 0.50 | 0.58 | 0.55 |  | 0.55 |
| 2 left "form a single lane" | 0.50 | 0.62 | 0.55 |  | 0.60 |

- Thank you very much!
